DETAILED ACTION

Amendment A, filed Jan 10, 2003, has been entered.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hardies (US 4015165) in view of Driessen et al. (US 4,501,799).

Hardies discloses an electric lamp with a glass lamp vessel closed in a gastight manner and in which an electric element is accommodated, current conductors connected to the element and having an end portion of molybdenum projecting outside the lamp with protection against oxidation and a skin on non-corrosive metal.

Hardies fails to clearly point out choosing from a group of materials formed by titanium nitride and chromium carbide and the thickness being at least 2 μm and at most 3 μm .

Driessen discloses choosing from a group of materials formed by titanium nitride and chromium carbide and the thickness being at least 2 μm and at most 3 μm in order to resist the unwanted highly corrosive action of the lamp filling and to keep the seal in the body at a temperature of not more than 1750 degrees C.

Hence it would have been obvious to one of ordinary skill in the art at the time the invention was made to use the lamp of Hardies and choosing from a group of

materials formed by titanium nitride and chromium carbide and the thickness being at least 2 μm and at most 3 μm in order to resist the unwanted highly corrosive action of the lamp filling and to keep the seal in the body at a temperature of not more than 1750 degrees C, as taught by Driessen.
